(57) Abstract :
The present invention, titled ThermoRevive, relates to a ihermoeleetrie energy reeo\er\' system designed to convert waste heat generated hy electrical transformers into usable eleetrieal energy, thereby improx ing their efficiency and extending their operational lifespan. During transformer operation, heal produced from core and copper losses is absorbed by ihermoeleetrie generator (TEG) modules mounted on the transformer easing or radiator fins. These modules utilize the Secbeck effect to generate direct current electricity from the temperature ditTerence between the heated transformer surface and a cooled heal sink. The generated power is conditioned through a voltage regulation circuit and cither stored in an energy storage unit or used directly to power auxiliary' devices electricity, the invention performance. The system providing a sustainable improvement. such as sensors, fans, or monitoring systems. By converting excess heat into reduces thermal stress, prevents insulation degradation, and enhances overall is compact, modular, and easily installable on both existing and new transformers, and maintenance-free solution for energy recoxery and transformer efficiency CMitorin
